# BRAIN HACKERS APP DEVELOPMENT CURRICULUM

# Lesson 6

# Balloon Pop App – Variables and Random Numbers

#### **SUMMARY**

In this lesson, an app will be created that uses variables whose values change as a user plays the game. This section also introduces the random number generator and the use of random numbers. A simple game will be created in which a balloon is inflated, but every time air is pumped into the balloon, there is a risk of popping the balloon and losing the game.

#### **DESIGNER WORKSPACE**

- For Screen1, set the BackgroundColor to Black NOTE: this app will use white text against a black background, which can be thought of as "Reverse Contrast"
  - Set the ScreenOrientation to "Portrait"

## **Key Concepts**

**Reverse Contrast** –contrast between features of a design is achieved through the opposite of what would usually be expected such as when white letters are used against a black background, instead of the typical black letters against a white background

- Place a Label to serve as a title at the top of the screen
  - Set the TextColor to White
  - Enter the text, "Balloon Pop"
- Place a Horizontal Arrangement below the title
  - Insert a Label
    - Change the Text to, "Score"
    - Change the TextColor to white
  - o Insert a second Label NOTE: this Label will serve as a spacer
    - Delete the text

- Insert a third Label NOTE: this Label will display the score
  - Change the text to, "0"
  - Change the TextColor to white
- Insert a Canvass
  - Set the Height to 300 pixels and the Width to Fill Parent NOTE: you may need to adjust the Height of the Canvass depending on the size of your screen
  - Set the BackgroundColor to White
- From the Drawing and Animation components, drag a Ball onto the Canvass and place the Ball near the center
  - Change the PaintColor for the Ball to Magenta
- Place a Horizontal Arrangement below the Canvass
  - Set the Width to Fill Parent
  - o Insert a Button NOTE: a user will tap this Button to inflate the balloon
    - Change the Text on the Button to, "Pump"
  - Insert a Label to serve as a spacer,
  - Insert a Button with the text, "Reset" NOTE: this Button will return the balloon to the size it started
- Adjust the Width of the spacer in the HorizontalArrangement so that the buttons are on the far right and left of the screen NOTE: the spacer serves to provide separation, which means placing space between two components that you do not want a user to accidentally confuse

## **Key Concepts**

**Separation** – providing space between components of a visual display, which can minimize the likelihood of the components being confused, such as accidentally pressing the wrong button

- Add a Button
  - Change the text to, "Restart Game" NOTE: this Button will allow a user to take the score back to "0"

**FIGURE 1**. This image shows the general layout of the screen, although the Viewer panel within MIT App Inventor does not correctly display the background colors

#### **BLOCKS WORKSPACE**

- From the Variables blocks, add an *initialize global* \_\_\_\_ *to* block NOTE: this block creates a variable that will be the limit at which the balloon will pop
  - Assign the variable the name, "Limit"

## **Key Concepts**

**Variable** – a symbol that is used to represent a value, with the potential for the value to change.

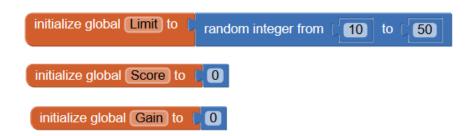

From the Math blocks, attach a *random integer from* \_\_\_\_ to \_\_\_ block to the slot of the block initializing the Limit variable – NOTE: this block selects a random number from the given range and assigns that number to the Limit variable

## **Key Concepts**

**Random Number** – a number for which it is impossible to predict its value based on the past or the present.

 Set the range for the random number so it is 20 to 100 – NOTE: a number will be selected that is between 20 and 100

- Add a second *initialize global* \_\_\_\_ to bock NOTE: this variable will be the player's ongoing score
  - Name the variable "Score"
  - Assign the variable a value of "0"
- Add a third *initialize global* \_\_\_\_ to block NOTE: this variable will be the number of points gained in a round and will be subtracted from the player's score if the balloon pops
  - Name the variable, "Gain"
  - Assign the variable a value of "0"

**FIGURE 2**. The blocks initializing the three variables should look like this.

- Add a *when* \_\_\_\_ .*Click do* block for the Pump Button
  - From the blocks for the Ball, add a set \_\_\_\_\_.Radius to block NOTE: this block increases the size of the ball each time the Pump Button is tapped
    - Attach an addition Math block that increases the current radius by 5
  - From the Variables blocks, add a set \_\_\_\_ to block NOTE: this expression increases the points awarded as the player pumps the balloon bigger and bigger
    - Change the set to block to the Score variable
      - Attach an addition Math block that increases the current score by the current radius of the ball
  - Add a set \_\_\_\_ to block NOTE: this block accumulates how many points have been awarded for the current round so these points can be subtracted from the score if the balloon pops
    - Change the set \_\_\_\_ to block to the Gain variable
      - Attach an addition Math block that increases the current gain by the current radius of the ball
  - From the blocks for the score value Label, add a set \_\_\_\_. Text to block NOTE: this block updates the score that is displayed each time the Pump Button is tapped
    - Attach a get \_\_\_\_ block for the current score

From the Control blocks, add an *if then* block – NOTE: this block provides
instructions for the condition where the balloon exceeds the limit and pops

# **Key Concepts**

**If then** – an expression that checks to see if some condition exists and instructs the program what to do if the condition exists

■ For the **if** slot, attach a comparison Math block – NOTE: this block asks if the balloon has exceeded the limit and popped • Set the comparison so it asks if the ball radius is greater than the Limit variable the ball to "5" - NOTE: this block returns the ball to its starting size • For the *then* slot, attach a *set* \_\_\_\_ *to* block that subtracts the Score by the Gain – NOTE: this block reduces the score by the number of points earned prior to popping the balloon ■ For the *then* slot, attach a *set to* block that returns the Gain to "0" – NOTE: this block returns the Gain variable to zero for the next round • For the *then* slot, attach a *set* .*Text to* block for the score value Label and attach a **get** \_\_\_\_ block for the current score – NOTE: this block updates the displayed score after the balloon pops • For the *then* slot, attach a *set* \_\_\_\_ *to* block for the Limit and attach a **random integer from \_\_\_\_ to \_\_\_** block with a range of 20 to 100 – NOTE:

this block sets a new value of the Limit variable for the next round

```
when Pump Button . Click
    set Ball1 . Radius to
                                     Ball1 v
                                             Radius *
    set global Score v to
                          get global Score *
                                                      Ball1 ▼
                                                              Radius *
    set global Gain v to
                                                             Radius *
                              get global Gain v
                                                    Ball1 ▼
    set Score_Value Label •
                            Text ▼ to get global Score ▼
    🔯 if
               Ball1 ▼
                        Radius *
                                  > v get global Limit
    then
          set Ball1 . Radius to 5
          set global Score v to
                                 get global Score
                                                        get global Gain v
          set global Gain v to 0
          set Score Value Label . Text to get global Score
          set global Limit v to random integer from
                                                           100
                                                  10 to
```

**FIGURE 3**. This image shows the blocks inserted into the **when** \_\_\_\_ .**Click do** block for the Pump Button.

- Add a **when** \_\_\_\_ .**Click do** block for the Reset Button NOTE: this block allows the user to return to the beginning without losing any points
  - o Insert a set \_\_\_\_.Radius to block returning the radius of the ball to "5"
  - o Insert a set \_\_\_\_ to block that returns the Gain to "0"
  - Insert a set \_\_\_\_ to block for the Limit and attach a random integer from \_\_\_\_ to \_\_\_ block with a range of 20 to 100

```
when Reset_Button v .Click
do set Ball1 v . Radius v to 5
set global Gain v to 0
set global Limit v to random integer from 10 to 100
```

**FIGURE 4**. This image shows the blocks inserted into the **when** \_\_\_\_ .**Click do** block for the Reset Button

- Add a when \_\_\_\_\_. Click do block for the Restart Game Button NOTE: this button allows a player to start a new game
   Insert a set \_\_\_\_\_ to block that returns the Score to "0"
   Insert a set \_\_\_\_\_. Text to block for the Score Value Label and attach a get \_\_\_\_\_ block for the current score
   Insert a set \_\_\_\_\_. Radius to block returning the radius of the ball to "5"
   Insert a set \_\_\_\_\_. Robits to block that returns to Gain to "0"
  - Insert a set \_\_\_\_ to block for the Limit and attach a random integer from \_\_\_\_ to \_\_\_ block with a range of 20 to 100

```
when Restart_Game_Button v .Click
do set global Score v to 0
set Score_Value_Label v . Text v to get global Score v
set Ball1 v . Radius v to 5
set global Gain v to 0
set global Limit v to random integer from 10 to 100
```

**FIGURE 5**. This image shows the blocks inserted into the **when** \_\_\_\_ .**Click do** block for the Restart Game Button

```
alize global Limit to random integer from 10 to 100
nitialize global Score to
                                                                      Pump_Button . Click
                                                                     set Ball1 . Radius to
                                                                                               Ball1 V Radius V + 5
nitialize global Gain to 🚺 0
                                                                      et global Score v to get global Score v + Ball1 v . Radius v
     Reset_Button .Click
                                                                      set global Gain 🔻 to 🖟 🤨 🔀 get global Gain 🔻 🛨 🖟 Ball1 🔻 . Radius 🔻
    set Ball1 v . Radius v to 5
                                                                     set Score_Value_Label v . Text v to get global Score v
     t global Gain 🔻 to 🚺 🕕
    set global Limit v to random integer from 10 to 100
                                                                     if Ball1 v . Radius v > v get global Limit v
                                                                          set Ball1 v . Radius v to 5
                                                                                                                    get global Gain 🔻

#### **BALLOON POP APP EXERCISE**

When the balloon pops, it is equivalent to a system crashing. It is comparable to when a bridge collapses due to excessive weight or a population of animals crashes due to the introduction of a new predator. However, in both natural and man-made systems, there are mechanisms in place that lessen the likelihood the system will crash. For example, people might notice cracks in the bridge long before it collapses or animals might learn to avoid predators. Based on the topic assigned, identify a system that could crash if placed under too much pressure and create a game like the Balloon Pop game that simulates that system. Through this activity, you are creating a model that reflects beliefs about how the system operates, with the game being a simulation of the system.
